

Wordle is a simple word-guessing game where the player has a limited number of attempts to guess a secret word. Even though it's simple, it became a worldwide phenomenon. After each guess, the game provides feedback on the number of correctly guessed characters and their positions. Here's the official explanation of the rules:

How To Play

Guess the Wordle in 6 tries.

- Each guess must be a valid 5-letter word.
- The color of the tiles will change to show how close your guess was to the word.

Examples

W E A R Y

W is in the word and in the correct spot.

P **I** L L S

I is in the word but in the wrong spot.

V A G **U** E

U is not in the word in any spot.

If you haven't played Wordle before, you check it out [here](#). I recommend playing a few times to get the hang of it. It's quite simple (and addictive!).

Project Instructions:

1. Create a class named `Wordle` with the following private fields:

- `secretWord` (String)
- `attempts` (int)

2. Add a constructor that takes a `String` parameter for the `secretWord` and an `int` parameter for the maximum number of `attempts`.

3. Add a public method named `play()` that contains the game loop.

4. In the `play()` method, implement the game loop that allows the user to guess the secret word until the maximum number of attempts is reached or the secret word is guessed correctly.

5. Provide feedback on the number of correctly guessed characters and their positions after each guess.

6. Create a class named `WordleGame` with a `main` method.

7. In the `main` method, instantiate a `Wordle` object with a secret word and a maximum number of attempts, then call the `play()` method.
